

10 March 2020

Chris Schneider  
Managing Director  
National Ceramic Industries Australia  
PO Box 765  
Maitland NSW 2320

Dear Chris,

### **Environmental Monitoring for National Ceramic Industries Australia - January 2020**

Please find enclosed the documentation for the environmental monitoring carried out for National Ceramic Industries Australia during January 2020. Sampling methodology and adopted assessment criteria are detailed below.

#### **1.0 Sampling Methodology**

Sampling was performed by AECOM Australia Pty Ltd (AECOM) and sample analysis was carried out by ALS NATA accredited laboratory. All sampling and analysis was carried out in accordance with Environmental Protection Authority (EPA) approved methods with reference to the following Australian Standards:

- Monitoring of fine suspended particulates (PM<sub>10</sub>) on the EPA six day cycle in accordance with:
  - AS/NZS 3580.9.6 (2015) Methods for the Sampling and Analysis of Ambient Air – Determination of Suspended Particulate Matter – PM<sub>10</sub> High Volume Sampler with Size Selective Inlet - Gravimetric Method.
- Monitoring of fluorides in ambient air in accordance with:
  - AS/NZS 3580.13.2 (2013) Determination of fluorides—Gaseous and acid-soluble particulate fluorides—Manual, double filter paper sampling.
- Meteorological monitoring in accordance with:
  - AS 3580.1.1 (2016) – *Methods for sampling and analysis of ambient air – Part 1.1 – Guide to siting air monitoring equipment; and*
  - AS 3580.14 (2014) – *Methods for sampling and analysis of ambient air – Part 14: Meteorological monitoring for ambient air quality monitoring.*
- Monitoring of surface water quality in accordance with:
  - AS/NZS 5667.1:1998(R2016) *Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples; and*
  - AS/NZS 5667.4:1998(R2016) *Guidance on sampling from lakes, natural and manmade.*

#### **2.0 Assessment Criteria**

Suspended particulate loads are assessed against the impact assessment criteria defined in the Project Approval conditions (09\_0006 – National Ceramic Industries Australia Tile Manufacturing Facility Expansion Project, 19 January 2012). The assessment criteria for PM<sub>10</sub> (particulate matter with an aerodynamic diameter of less than 10 µm) are:

- 50 µg/m<sup>3</sup> over a 24-hour period; and
- 30 µg/m<sup>3</sup> as an annual average.

Ambient fluoride concentrations are assessed against the guidelines defined in NSW EPA *Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales* (NSW EPA (2016)). The NSW EPA impact assessment criteria for ambient fluoride are:

- 2.9 µg/m<sup>3</sup> over a 24-hour period; and
- 1.7 µg/m<sup>3</sup> over a 7-day period.

Surface waters are assessed in accordance with default trigger values for physical and chemical stressors for southeast Australia in the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZG, 2018). These values are:

- pH in the range of 6.5 - 8.5 (Table 3.3.2 - NSW Lowland River); and
- Electrical conductivity (EC) in the range of 125 – 2200  $\mu\text{S}/\text{cm}$  (Table 3.3.3 - NSW Lowland River).

### 3.0 Monitoring Results

Monitoring results for the month of January 2020 are presented in the attachments to this letter. Monitoring results for the preceding two months are also presented to demonstrate quarterly trends in results.

The January 2020 monitoring results show that all ambient  $\text{PM}_{10}$  results were below the short-term impact assessment criterion ( $50\mu\text{g}/\text{m}^3$ ) as defined in the DPIE Project Approval (Schedule 3, Condition 15, Table 2):

The  $\text{PM}_{10}$  rolling annual average concentration at the South East site remains below the Project Approval annual criterion of  $30\mu\text{g}/\text{m}^3$  with an average of  $25.3\mu\text{g}/\text{m}^3$  following the January monitoring period. The North West annual average is currently above the criteria at  $37.0\mu\text{g}/\text{m}^3$  following the completion of the January monitoring period, largely due to elevated results recorded during November and December 2019 caused by regional heavy bushfire smoke.

Fluoride results for January remain below the relevant assessment criteria at both the North West and South East monitoring sites with no exceedances of either the 24 hour or 7 day criteria this month.

The adopted ANZG 2018 guidelines for pH and conductivity are the default trigger values for slightly disturbed aquatic ecosystems in NSW lowland rivers. pH measurements for January were recorded within the ANZG guidelines except for the measurement taken on 23 January which was above the 8.5 upper limit. Importantly, Pond 4 was not observed to be discharging on any sampling occasions during January. All conductivity measurements were within the relevant ANZG guidelines for January. Water temperature was also measured weekly however no guideline is available for assessment.

The monitoring locations, monitoring results and plots can be found attached including the wind rose for January. Laboratory certificates, field sheets and calibration data along with relevant meteorology data can be provided on request.

If you require any further information, please contact Cye Buckland on 0488 777 160.
